**Agricultural machinery – Rice precision seeder –  
Methods of test**

**BUREAU OF PRODUCT STANDARDS\***

Member to the International Organization for Standardization (ISO)  
Standards and Conformance Portal: [www.bps.dti.gov.ph](http://www.bps.dti.gov.ph)

**\*BUREAU OF PHILIPPINE STANDARDS**

**National Foreword**

The Philippine Agricultural Engineering Standards PAES 172:2015, Agricultural machinery – Rice precision seeder – Methods of test was approved for adoption as Philippine National Standard by the Bureau of Philippine Standards upon the recommendation of the Agricultural Machinery Testing and Evaluation Center (AMTEC) and the Philippine Council for Agriculture, Aquatic and Natural Resources Research and Development of the Department of Science and Technology (PCAARRD-DOST).

## **Foreword**

The formulation of this national standard was initiated by the Agricultural Machinery Testing and Evaluation Center (AMTEC) under the project entitled “Development of Standards for Rice Production and Postproduction Machinery” which was funded by the Philippine Council for Agriculture, Aquatic and Natural Resources Research and Development (PCAARRD) of the Department of Science and Technology (DOST).

This standard has been technically prepared in accordance with PAES 010-2 – Rules for the Structure and Drafting of International Standards.

The word “shall” is used to indicate mandatory requirements to conform to the standard.

The word “should” is used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others.

## **1 Scope**

This standard specifies the methods of test and inspection for mechanically operated rice precision seeder for dryland and wetland operation. Specifically, it shall be used to:

- 1.1** verify the mechanism, dimensions, materials and accessories of the rice precision seeder and the list of specifications submitted by the manufacturer;
- 1.2** determine the field performance of the seeder;
- 1.3** evaluate the ease of handling and safety features and;
- 1.4** prepare a report on the results of the tests.

## **2 Reference**

The following normative documents contain provisions, which through reference in this text, constitute provisions of this National Standard:

**PNS/PAES 103:2000** Agricultural Machinery – Method of Sampling

**PNS/PAES 171:2015** Agricultural Machinery – Rice Precision Seeder – Specifications

## **3 Definition**

For the purpose of this standard, the definition of the terminologies given in PNS/PAES 171:2015 and the following shall apply:

### **3.1**

#### **actual field capacity**

actual rate of planting for a given area per unit of time

**NOTE** The time includes the time spent for turning at headland, adjustment of machine and machine downtime

### **3.2**

#### **damaged seed**

seed distinctly damaged during operation

### **3.3**

#### **field efficiency**

ratio of actual field capacity to the theoretical field capacity

### **3.4**

#### **hopper capacity**

maximum allowable amount of seeds (kg) which can be loaded to the hopper

**NOTE** Shall follow manufacturer's recommendation

### **3.5**

#### **percent damaged seeds**

percentage of seeds damaged during operation

### **3.6**

#### **theoretical field capacity**

computed area planted per unit of time

## **4 General Conditions for Test and Inspection**

### **4.1 Selection of rice precision seeder to be tested**

Rice precision seeder to be tested should be in accordance with PNS/PAES 103:2000 Agricultural Machinery – Method of Sampling.

### **4.2 Role of requesting party**

The requesting party shall submit to the official testing agency specifications and other relevant information on the rice precision seeder. He shall abide with the terms and conditions set forth by an official testing agency.

### **4.3 Role of the manufacturer**

An officially designated representative of the manufacturer should operate, adjust, repair, and should decide on matters related to the operation of the machine.

### **4.4 Test site conditions**

The rice precision seeder shall be tested through actual seeding operation. Each test, with three replications, shall be carried out in a rectangular field area with sides in the ratio of 2:1 as much as possible. The field shall have an area of at least 1000 m<sup>2</sup> for mechanically operated seeders.

### **4.5 Suspension of test**

If during the test, the machine malfunctions or stops due to major component breakdown, the test shall be suspended.

## **5 Test Preparation**

### **5.1 Running-in and preliminary adjustment**

Before the start of the test, the rice precision seeder should have undergone running-in period wherein various adjustments of the rice precision seeder shall conform with the recommendation of the manufacturer.

### **5.2 Test instruments and other materials**

The instruments to be used shall have been calibrated and checked by the testing agency prior to the measurements. The suggested list of minimum field and laboratory test equipment and materials needed to carry out the rice precision seeder test is shown in Annex A.

## **6 Pre-test Observation**

### **6.1 Verification of specifications**

The specifications claimed by the manufacturer and physical details given in Annex B shall be verified by the official testing agency. A stable and level surface shall be used as reference plane for verification of dimensional machine specifications.

## **7 Laboratory Performance Test**

### **7.1 Test for metering mechanism**

**7.1.1** This is carried out to examine the performance of the metering mechanism. The result of which can provide the basic data for the field performance.

**7.1.2** This test should be conducted using a suitable type of seed as specified by the manufacturer.

**7.1.3** In case of other seeder, it will be jacked up and the drive wheel of the metering mechanisms is rotated in a number of revolutions to collect sufficient amount of seeds to compute for its delivery rate. The delivery rates per hectare are calculated with the weight of seeds from the delivery tube with the corresponding distance travelled by the seeder based on the number of revolutions of the drive wheel.

**7.1.4** If possible, this test shall be carried out at full, half and one-fourth of the seeder's hopper capacity with three delivery rate settings – low, medium and high.

**7.2** The items to be investigated and measured shall be recorded in Annex D.

## **8 Field Performance Test**

This test is carried out to obtain actual data on overall machine performance, operating accuracy, work capacity and adaptability to field conditions.

### **8.1 Data collection**

#### **8.1.1 Soil data analysis**

Initial data such as field area and soil type shall be obtained and recorded in Annex C before the test operation.

#### **8.1.2 Duration of test**

The duration of each test trial shall start with the first seeding and ends after the final seeding of the test area.

#### **8.1.3 Field performance test**

**8.1.3.1** Measure at random two-meters along each row for at least ten rows planted by theseeder. For each two meter distance, measure/record the following:

**8.1.3.1.1** depth of seeding (for dryland operation)

**8.1.3.1.2** distance between hills

**8.1.3.1.3** number of seeds planted per hill

**8.1.3.1.4** number of missed hills

**8.1.3.1.5** number of damaged seeds

**8.1.3.1.6** number of hills with incorrect number of seeds delivered

**8.1.3.2** Other items to be measured and computed are:

**8.1.3.2.1** Performance and accuracy

**8.1.3.2.1.1** Population of seeds planted per unit area

**8.1.3.2.1.2** Rate of missing hills

**8.1.3.2.1.3** Wheel slippage and sinkage (for dryland operation only)

**8.1.3.2.2** Work rate and labor requirement

**8.1.3.2.2.1** Actual traveling speed

- 8.1.3.2.2.2 Actual operating time
- 8.1.3.2.2.3 Time spent for turning at headland
- 8.1.3.2.2.4 Time spent for machine downtime
- 8.1.3.2.2.5 Fuel consumed (mechanically operated)
- 8.1.3.2.2.6 Required number of workers
- 8.1.3.3 Other items to be observed are:
  - 8.1.3.3.1 Handling and operation
  - 8.1.3.3.2 Turning
  - 8.1.3.3.3 Refilling of seed
  - 8.1.3.3.4 Adjustments

#### 8.1.4 Noise level

The noise emitted by the machine shall be measured using a noise level meter. The noise, expressed in dB(A), shall be taken approximately 5cm away from the ear level of the operator.

#### 8.1.5 Operating speed

Outside the longer side of the test plot, two poles 20 m apart (A, B) are placed approximately in the middle of the test plot (Figure 1). On the opposite side, two poles are also placed in similar position, 20 m apart (C, D) so that all four poles form corners of a rectangle, parallel to at least one long side of the test plot. The speed will be calculated from the time required for the machine to travel the distance (20 m) between the assumed line connecting two poles on opposite sides AC and BD. The reference point (e.g. front wheels) of the machine should be selected for measuring the time.

**Figure 1 - Operating Speed Measurement**

### **8.1.6 Fuel consumption**

Before the start of each test trial, fuel tank shall be filled to certain marked level. After each test trial, the tank shall be refilled using a graduated cylinder. The amount refilled is the fuel consumption for the test.

### **8.1.7 Data recording and observations**

Record sheet for all data, information during the test, and other observations are given in Annex C.

## **9 Data Analysis**

### **9.1 Calculation**

The formula to be used during calculations and testing is given in Annex E.

### **9.2 Presentation of results**

Machine specifications and the results of the test shall be presented in tabular form using the data from Annexes B to D. Observations made on the machine while in operation shall be supported with photographs.

## **10 Test Report Format**

The test report must include information in the following order given:

### **10.1 Title**

### **10.2 Summary of Results**

### **10.3 Purpose and Scope of Test**

### **10.4 Methods of Test**

### **10.5 Condition of the Machine**

### **10.6 Description of the Machine**

### **10.7 Table 1 Machine Specifications**

### **10.8 Results of Test**

### **10.9 Table 2 Field Performance Data**

**10.10** Observations (include pictures)

**10.11** Names and Signatures of Test Engineers

**Annex A**  
**Minimum List of Field and Laboratory**  
**Test Equipment and Materials**

<b>A.1</b>	<b>Equipment</b>	<b>Quantity</b>
<b>A.1.1</b>	Noise Level Meter Range: 30 to 130 db(A)	<b>1</b>
<b>A.1.2</b>	Timers (range: 60 minutes) Accuracy: 1/10 sec	<b>2</b>

<b>D.1.2.3.4</b> Delivery for D.1.2.2.3, kg									
<b>D.1.2.3.5</b> Delivery rate, kg/ha									
<b>D.1.2.3.6</b> Quantity of damaged seeds by metering mechanism, %									
<b>D.1.2.4</b> Pattern of seed deposition (line, band, hill, single seed, precision planting)									

**Annex E**  
(informative)

**Formula Used During Calculations and Testing**

**E.1** Field Performance Test

**E.1.1** Delivery Rate

**E.1.1.1** Nominal working width, W, (m)

$$W = n \times d_r$$

where:

W is the nominal working width, m  
n is the number of rows  
d<sub>r</sub> is the row spacing, m

**E.1.1.2** Ground wheel-driven machine

**E.1.1.2.1** Effective diameter of ground wheel under load

$$D_e = \frac{d}{\pi \times N}$$

where:

D<sub>e</sub> is the effective diameter, m  
N is the number of revolutions, rpm  
d is the distance for a given N, m

**E.1.1.2.2** Seeding rate

$$Q = \frac{L \times 10,000}{\pi D_e \times N \times W}$$

where:

Q is the delivery rate, kg/ha  
L is the delivery for a given N, kg

### E.1.1.3 PTO-driven machine

$$Q = \frac{L \times 10,000}{S \times t \times W}$$

where:

Q is the delivery rate, kg/ha

L is the delivery for a given N, kg

S is the speed of operation, m/s

t is the time for measuring delivery, s

### E.1.2 Actual Field Capacity

$$FC_A = \frac{A_T}{T_T}$$

where:

FC<sub>A</sub> is the actual field capacity, ha/h

A<sub>T</sub> is the area covered during test, ha

T<sub>T</sub> is the total operating time, h

### E.1.3 Theoretical Field Capacity

$$FC_T = \frac{W_C S}{10}$$

where:

FC<sub>T</sub> is the theoretical field capacity, ha/h

W<sub>C</sub> is the nominal working width, m

S is the operating speed, km/h

### E.1.4 Field Efficiency

$$\text{Eff} = \frac{FC_A}{FC_T} \times 100$$

where:

Eff is the field efficiency, %

FC<sub>A</sub> is the actual field capacity, ha/h

FC<sub>T</sub> is the theoretical field capacity, ha/h

### E.1.5 Seeding Efficiency

$$SE = 1 - \left( \frac{E-A}{E} \right) \times 100$$

where:

SE is the seeding efficiency of the rice precision seeder, %

E is the expected amount of seeds to be dropped, pc

A is the actual amount of seeds dropped, pc

### E.1.6 Fuel Consumption

$$FC = \frac{F_1}{T_T}$$

where:

FC is the fuel consumption, L/h

F<sub>1</sub> is the amount of fuel consumed, L

T<sub>T</sub> is the time of operation, h
